You can find a complete list of Photoshop's brushes in this chapter. (The _Basic_ set comes preinstalled in Photoshop CS6, but I explain how to add custom brushes in the next section.) You can also use the Pen tool to draw lines, circles, and rectangles — perfect for drawing and measuring images. See Chapter 4 for more on the Pen tool. The list in the following section lists some of Photoshop's most commonly used features in order of most useful to least useful. # Updating the Fax Numbers in an EPS File If you edit an EPS file, you may need to change the fax numbers in the EPS file in order to update the originals. An EPS file stores the exact dimensions of all the artwork. It is different from a JPG or TIFF file, which is a compressed picture file. Because of this, when you update or create an EPS file, you need to change the fax numbers as well. This is why you save the EPS file after editing and adding text and other content. When you perform a print preview, Photoshop tells you the file extension (for example, .eps) and the postscript (PostScript) output of the file. You can use these extensions to open the EPS file in other programs that will allow you to change the fax numbers. For example, a graphics program such as Adobe Illustrator may open the EPS file and allow you to change the fax number. The Adobe Photoshop CS6 program helps you to easily add text to an EPS file. In this example, I add a telephone number to an EPS file. Creating a neat print preview Before you open an EPS file, make sure that the file is compatible with the program you plan to use it in. PostScript printers use PostScript, and EPS files use the EPS PostScript extension. (To learn more about PostScript, jump to Chapter 2.) If you know you will be printing your work on a PostScript printer, make sure that the files are the type used by the printer. To see a neat print preview, open the EPS file in Adobe Photoshop. The default mode is the Photoshop Print Preview. If the file is not compatible with the program you're using, click the Preview tab to open the EPS file in Photoshop. Then, click the Print button at the bottom left of the screen. You see a preview of your picture with all the text added. You can increase the size of the

Q: Is a list of strings with length, no repeating values always unique? In Python 3.5.2, what is the fastest way to create a list of strings with a specified length but without repeating values? This seems hard so here is an example: li = ['a', 'a', 'b', 'b', 'c', 'd', 'd', 'a'] A: In Python 3, you can use the Counter class: >>> from collections import Counter >>> li = ['a', 'a', 'b', 'b', 'c', 'd', 'd', 'a'] >>> c = Counter(li) >>> c Counter({'a': 2, 'c': 1, 'b': 2, 'd': 2}) Or, for Python 2.7: >>> from collections import defaultdict >>> li = ['a', 'a', 'b', 'b', 'c', 'd', 'd', 'a'] >>> d = defaultdict(int) >>> for k, v in li: ... d[k] += 1 ... >>> d defaultdict({'a': 2, 'c': 1, 'b': 2, 'd': 2}) defaultdict is a counter implementation that uses a dictionary. Q: Spring Boot Websocket, Smart client We have a Smart client that sends data to a server. This client uses Spring Websockets to send data. The Smart Client subscribes a channel so the client can get messages from the server. And when a message arrives, the client can do something with that message. If I want to send an event from my server to another Smart Client, what will happen to the connection of the Smart Client that subscribes to the channel? This other Smart Client will receive the event? Or both Smart Clients will receive the event? Does this mean both channels need to be up and running? A: If you use WebSocketChannelInterceptor, the client channel will be closed when it gets the message from the server. When you use @MessageMapping, the message is mapped to a ChannelInterceptor. There can be only one MessageMapping per channel. So if a ChannelInterceptor returns a response, it closes the channel. If the application returns a response,
